

FOOTBATH ADDITIVE

HOW HOOFMAX™ WORKS

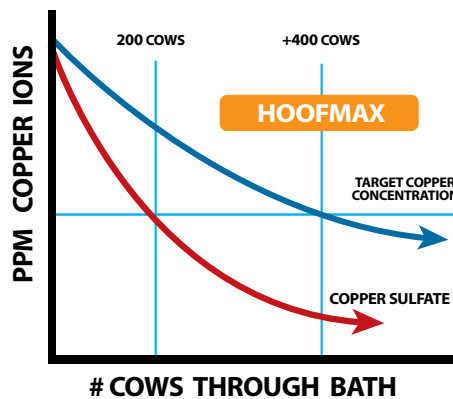

Hoofmax™ binds to hydroxide ions (OH-) found in manure and urine, preventing them from neutralizing copper ions (Cu+).

This makes more copper available for killing pathogens and promoting hoof hardness.

Cut copper usage up to 80% with HoofMax™

The original additive designed to optimize footbaths based on copper or zinc sulfate, to keep copper working even in the presence of heavy organic matter loading.

- Highly concentrated formula allows producers to achieve the same level of control with substantially less copper and expense.
- elivers more consistent, effective results than a traditional copper sulfate footbath.
- Includes a surfactant to pre-clean hooves so copper can better affect the surface of the hoof.
- Can help reduce copper loading on land.
- Includes a blue color so users can identify the product in a container or the bath.
